CLAIM AMENDMENTS

IN THE CLAIMS

This listing of the claims will replace all prior versions, and listing, of claims in the application or previous response to office action:

1-3. (Canceled)

4. (**Currently Amended**) A method for generating an object processing platform between an object computer and a processing computer, wherein an ad hoc screen assembly is performed by the object computer with the processing computer to couple a respective input and/or output device, comprising:

activating a local file processing function **on the object computer,** ~~**wherein at least one display belongs to a processing computer having an interaction area**~~; and

generating an object processing platform by moving an object from a display belonging to the object computer to **[[the]]** **an** interaction area of **[[the]]** **a** display belonging to the processing computer**,** ~~**wherein the local processing function is activated by a local coupling of the object to the interaction area**~~

wherein activating the local file processing function comprises moving the object from the object computer to the interaction area.

5. (Previously Presented) The method according to claim 4, further comprising an application-specific processing of the object is started by a further coupling of the object to an application icon on the display belonging to the processing computer.

6. (Previously presented) The method according to claim 5, wherein the object-computer-specific data of the object is converted into application-specific data.

7. **(NEW)** A system for generating an object processing platform between an object computer and a processing computer, wherein an ad hoc screen assembly is performed by the object computer with the processing computer to couple a respective input and/or output device, wherein the object computer is operable to activate a local file processing function, wherein the object processing platform is generated by moving an object from a display belonging to the object computer to an interaction area of a display belonging to the processing computer, and wherein activating the local file processing function comprises moving the object from the object computer to the interaction area.

8. **(NEW)** The system according to claim 7, further comprising an application-specific processing of the object is started by a further coupling of the object to an application icon on the display belonging to the processing computer.

9. **(NEW)** The system according to claim 8, wherein the object-computer-specific data of the object is converted into application-specific data.

10. **(NEW)** A system comprising:

a combination of an object computer and a processing computer, wherein the combination is operable to perform an ad hoc screen assembly to couple a respective input and/or output device, wherein the object computer is operable to activate a local file processing function, wherein an object processing platform is generated by moving an object from a display belonging to the object computer to an interaction area of a display belonging to the processing computer, and wherein activating the local file processing function comprises moving the object from the object computer to the interaction area.

11. (**NEW**) The system according to claim 10, further comprising an application-specific processing of the object is started by a further coupling of the object to an application icon on the display belonging to the processing computer.

12. (**NEW**) The system according to claim 11, wherein the object-computer-specific data of the object is converted into application-specific data.
